

Talha Anjum

Senior Java Backend Engineer

hello@talhaanjum.dev • [linkedin.com/in/talha-anjum](https://www.linkedin.com/in/talha-anjum) • github.com/talha-anjum • Remote — Available Worldwide

SUMMARY

Senior backend engineer with 9+ years designing and shipping enterprise Java systems — healthcare data integration platforms, high-throughput LIMS backends, event-driven order processing systems, legacy modernisation, cloud migrations, and high-performance API gateways. Focused on pragmatic architecture, measurable outcomes, and systems that remain maintainable long after handoff.

CORE SKILLS

Languages	Java 17/21, SQL, TypeScript
Frameworks	Spring Boot, Spring Cloud, Hibernate, Spring WebFlux
Databases	PostgreSQL, Oracle, Redis, MongoDB
Cloud & DevOps	AWS (EKS, RDS, S3), Terraform, Docker, Kubernetes
Messaging	Apache Kafka, RabbitMQ, event-driven architecture
Testing	JUnit 5, Mockito, Testcontainers, Gatling
Architecture	Microservices, DDD, CQRS, Event Sourcing, Saga pattern

SELECTED ENGINEERING WORK

Healthcare Data Integration Platform

Healthcare / HealthTech — Lead Backend Architect

Designed and led delivery of an HL7v2/FHIR interoperability engine unifying patient data across 40+ hospital systems in real time, cutting p95 message latency from 4.8s to 310ms.

Laboratory Information Management System

Diagnostics / Life Sciences — Lead Backend Engineer

Built a regulatory-grade LIMS backend modeling the full sample lifecycle as an auditable state machine, supporting 50,000+ samples/day across 15+ analyzer integrations.

Enterprise Order Processing Platform

Retail / Distribution — Backend Lead

Replaced a 30-minute batch order pipeline with a Saga-based, event-driven architecture, reducing order confirmation latency to under 800ms and cutting overselling incidents by 98%.

Legacy Monolith Modernisation

Financial Services — Modernisation Architect

Led a strangler-fig migration of a 15-year-old Java monolith into modular services with zero downtime, increasing weekly deployment frequency 12x.

Cloud Migration Platform

Enterprise SaaS — Migration Lead

Directed a phased lift-and-optimize migration from on-premises infrastructure to AWS, reducing infrastructure cost by 34% with zero customer-facing downtime.

High Performance REST API Gateway

B2B Platform / Multi-tenant SaaS — Gateway Architect

Built a reactive Java API gateway handling 200+ downstream services, cutting gateway overhead from ~140ms to under 9ms at the p95.

ENGINEERING PHILOSOPHY

Problem-first architecture, systems designed for the load they will actually carry, production-grade practices (testing, observability, rollback plans) built in from day one, and code written to outlive the engineer who wrote it.
